Run 1

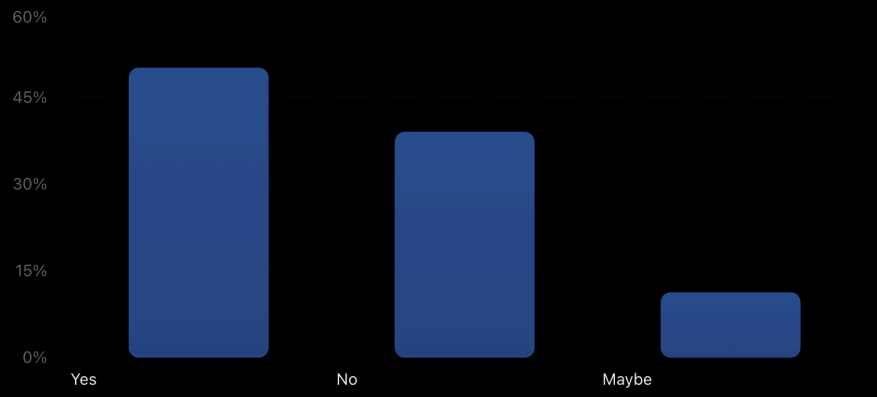

Survey Results

Question: “Was it easy to save an Instagram Story as a draft?”

Answer Category	Count	Percentage
Yes	9	50.00%
No	7	38.89%
Maybe	2	11.11%
Total Valid	18	100.00%
Missing	2	—
Total Responses	20	—

Distribution of Valid Responses

Percentage of valid survey responses (n = 18)

Explanation

I normalized all responses by removing surrounding whitespace and converting text to lowercase. This grouped variations such as “Yes,” “YES,” and “yes” into the same category.

Responses 6 (blank) and 12 (one space) were classified as missing and excluded from the percentage calculations.

There were **18 valid responses** and **2 missing responses** out of 20 total responses.

Percentages were calculated using:

$$\text{Percentage} = \frac{\text{Category Count}}{18} \times 100$$

- **Yes:** 9/18 × 100 = 50.00%
- **No:** 7/18 × 100 = 38.89%
- **Maybe:** 2/18 × 100 = 11.11%

Conclusion: Half of the valid respondents (50.00%) found saving an Instagram Story as a draft easy, while 38.89% did not and 11.11% were unsure.

Run 2

Survey Response Analysis

After normalizing capitalization and removing surrounding whitespace, the 20 responses fall into three valid categories: **Yes, No, and Maybe**.

Results

Answer category	Count	Percentage
Yes	9	50.00%
No	7	38.89%
Maybe	2	11.11%
Total valid	18	100.00%
Missing	2	Excluded
Total responses	20	

Distribution of Valid Responses

18 valid responses, excluding 2 missing responses

Calculation

The responses were standardized by converting all text to lowercase and trimming surrounding whitespace. Two responses (#6 and #12) contained no meaningful content and were classified as missing.

Percentages were calculated using only the **18 valid responses**:

$$\text{Percentage} = \frac{\text{Category count}}{18} \times 100$$

Conclusion

Half of the valid respondents (50.00%) reported that saving an Instagram Story as a draft was easy. However, 38.89% answered No and 11.11% answered Maybe, suggesting that the draft-saving feature may present usability challenges for some participants.

Run 3

Survey Response Analysis

After normalizing capitalization and surrounding whitespace and excluding missing responses, **18 out of 20 responses are valid**.

Results

Answer category	Count	Percentage
Yes	9	50.00%
No	7	38.89%
Maybe	2	11.11%
Total valid	18	100.00%

- **Valid responses:** 18
- **Missing responses:** 2 (responses #6 and #12)
- **Total responses:** 20

Calculation Method

First, responses were standardized by removing surrounding whitespace and converting text to lowercase. Blank responses and whitespace-only responses were treated as missing.

Percentages were calculated using the 18 valid responses as the denominator:

$$\text{Percentage} = \frac{\text{Category Count}}{18} \times 100$$

- Yes: $9/18 \times 100 = 50.00\%$
- No: $7/18 \times 100 = 38.89\%$
- Maybe: $2/18 \times 100 = 11.11\%$

Conclusion: Half of the valid respondents found saving an Instagram Story as a draft easy, while 38.89% answered No and 11.11% answered Maybe. This suggests that the draft-saving feature may present usability challenges for some participants.

Run4:

Cleaning rules applied: lowercase everything and trim whitespace. Response 6 (blank) and response 12 (a single space) become empty after trimming, so both count as missing.

Tally by response number:

- **Yes:** 1, 4, 7, 9, 10, 13, 16, 19, 20 → **9**
- **No:** 2, 3, 8, 11, 14, 15, 18 → **7**
- **Maybe:** 5, 17 → **2**
- **Missing:** 6, 12 → **2**

Check: 9 + 7 + 2 + 2 = 20 ✓

Results

Category	Count	Percentage of valid responses
Yes	9	9 / 18 = **50.00%**
No	7	7 / 18 = **38.89%**
Maybe	2	2 / 18 = **11.11%**
Total valid	**18**	**100.00%**

- **Valid responses:** 18
- **Missing responses:** 2 (responses 6 and 12)

How I got there: After normalizing case and whitespace, the 20 responses fall into three real categories plus two empty entries. The one-space response is the easy one to overlook: it looks like an answer but contains no content once trimmed. I removed the two missing entries from the denominator, leaving 18 valid responses, and divided each category count by 18. The percentages sum to exactly 100.00% (50.00 + 38.89 + 11.11).
